Coulomb Hamiltonian
electrons and point nuclei
Sect. 2.3
clamp the nuclei on a lattice
Lattice and reciprocal space
Brillouin zone; crystal momentum; lattice sum
Sect. 3.1
one electron in a periodic potential
Bloch states and bands
nearly free electrons; tight binding; density vertex
Sect. 3.2
expand at the band edges
Si, Ge and GaAs
valleys; k · p masses; spin-orbit; minimum pair energy
Sect. 3.3
model potential → Kohn-Sham
Kohn-Sham equations
Hartree-Fock; density functionals; band-gap problem
Sect. 3.4
correct the Kohn-Sham gap
Scissor shift
rigid conduction bands; rescaled velocity
Sect. 3.4
expand in plane waves; drop the core
Plane waves and pseudopotentials
cutoff; frozen core; all-electron vertex from PAW
Sect. 3.5
restore the core
Core states
semicore shells; relativistic corrections
Sect. 3.5
rotate to localized orbitals
Wannier functions
maximal localization; exact interpolation; one gauge
Sect. 3.6
interpolate on fine grids
Density vertex of silicon
⟨mk + q|e^{iq·r}|nk⟩ from first principles
Chaps. 4, 10
