Responses and readout
S_{ab} per channel, final-state classes;
pair energies, collection, backgrounds
previous chapters
contract with the halo
Rate assembly
halo functional and rate kernel;
$\eta(v_{\min})$ of the standard halo; floors
Sect. 21.1; Limit Check 21.1
drop the halo model
let $v_{\min}$ reach $v_{\max}$
Halo-independent bounds
linear program over velocity
distributions; streams; certificate
Sect. 21.2; Limit Check 21.2
Kinematic edge
power law near $m_{\min}$;
threshold, gap and halo degeneracy
Sect. 21.3
add theory
nuisances
Theory nuisances in a limit
Poisson limit; profiled truncation
nuisances; theory band per channel
Sect. 21.4
unknown background;
several experiments
tabulate for reuse
Statistics and recasting
unknown background; shared nuisances;
recast for a corrected response
Sect. 21.5
Response libraries
tables in $(q, \hat{\mathbf{q}}, \omega)$ per operator;
conventions, versions, provenance
Sect. 21.6
add rankings, pair energies,
readout, backgrounds
Next targets
leader per channel with its probability;
missing demonstration; deciding measurement
Sect. 21.7
Open problems
what stays open, by chapter
next chapter
